# MATH 127 Calculus for the Sciences

Lecture 1

September 3, 2025

1/12

### Information

Instructor | Jiahui (Kent) Huang; Email:j346huan@uwaterloo.ca

Learn | Use the website called Learn to access course material, including

- Course outline; course schedule; course notes
- Exercises, practice exams.

**Odyssey** Use the website called Odyssey to find quiz/midterm/exam seating.

Piazza Use the forum called Piazza to ask questions, answer other people's questions, and discuss.

Quiz 1 is on Sept 10. The first quiz includes questions about high school algebra and calculus which we will not review in lecture.

# Today's lecture

Course note coverage Section 1.1.1 - 1.1.2

**Definition of derivative** Differentiability

Computation of derivative

Common derivatives

Rules of differentiation

### Motivation

**Question** Assume an object has height  $t^2$  at time t. What is the speed of the object at the moment t = 0?

### Derivative

**Definition** Let y = f(x) be a function. The **derivative of** y is the function

Given a specific number a, the derivative of y at x = a is the value

#### Remark

The domain of the derivative is where the limit on the right-hand side exists.

If the limit exists everywhere, then we say the function is differentiable.

The derivative of a function at a point is a number.

If the limit exists at a specific point x = a exists, then we say the function is differentiable at a.

## Notations for derivatives

Since the derivative of a function is a function, we can take the derivative of a derivative. Doing this n times, we get the n-th derivative of y = f(x).

### Notation

The n-th derivative of f(x) is

The n-th derivative at a is

**Example** The derivative of  $x^2$  is the function denoted  $(x^2)' = 2x$ .

#### Notation

The *n*-th derivative of y = f(x) is

The n-th derivative at a is

**Example** The second derivative of  $y = x^2$  is the function  $\frac{d^2y}{dx^2} = 2$ .

# Derivatives might not exist

**Question** Assume an object has height |t| at time t. What is the speed of the object at the moment t = 0?

# Examples of non-differentiable functions

The following are some (not all) of the cases where a function is not differentiable.

**Example** If f has a sharp corner at 
$$x = a$$
, e.g.  $f(x) = |x|$ .

**Example** If f has a vertical tangent at 
$$x = a$$
, e.g.  $f(x) = x^{1/3}$ .

**Example** If f is not continuous at 
$$x = a$$
, e.g.  $f(x) = \begin{cases} 1, & \text{if } x \leq 1, \\ 0.5, & \text{if } x > 1. \end{cases}$ 

## Common derivatives

You should know the derivatives of the following functions from high school.

- 1. If f(x) = c for c a constant, then f'(x) = 0.
- 2. If  $f(x) = x^n$  for an integer  $n \neq 0$ , then  $f'(x) = nx^{n-1}$ .
- 3. If  $f(x) = e^x$ , then  $f'(x) = e^x$ .
- 4. If  $f(x) = \sin(x)$ , then  $f'(x) = \cos(x)$ .
- 5. If  $f(x) = \cos(x)$ , then  $f'(x) = -\sin(x)$ .

### Derivatives rules

You should know the following rules from high school. Suppose c is a number, and f,g,h are functions.

1. If 
$$h(x) = cf(x)$$
, then  $h'(x) = cf'(x)$ . (Constant rule)

2. If 
$$h(x) = f(x) + g(x)$$
, then  $h'(x) = f'(x) + g'(x)$ . (Sum rule)

3. If 
$$h(x) = f(x) \cdot g(x)$$
, then  $h'(x) = f'(x) \cdot g(x) + f(x) \cdot g'(x)$ . (Product rule)

4. If 
$$h(x) = f \circ g(x) = f(g(x))$$
, then  $h'(x) = f'(g(x))g'(x)$ . (Chain rule)

# The quotient rule

### Question (Quotient rule)

If 
$$h(x) = \frac{f(x)}{g(x)}$$
, how to compute  $h'(x)$  in terms of  $f$  and  $g$ ?

# Example

**Question** Assume the mass M (in kg) of an object of radius r (in cm) is

$$M(r) = \frac{e^r + 3r}{r^3}$$

Find the rate of change of the mass with respect to the radius.
