

MATH 127 Calculus for the Sciences

Lecture 22

Today's lecture

Last time

Limit at infinity

Indeterminant form

This time

Course note coverage Section 3.2.2 and 3.2.3

More on indeterminate forms.

Quiz 6 is today

Coverage

1. Everything covered up to the midterm
2. Continuity: for which inputs is a function is continuous? (check using definition or continuity rule)
3. Evaluating limits: using graph, or using algebra
4. Determinate form: identify them, evaluate them
5. Indeterminate form: identify them (you don't need to know how to evaluate them)

Recap

The following are determinate forms we have seen so far, and two indeterminate forms that we learn how to deal with today.

Determinate form	evaluation
$\frac{1}{0^+}, \frac{\infty}{0^+}, \infty + \infty, \infty^\infty$	∞
$\frac{1}{0^-}, \frac{\infty}{0^-}$	$-\infty$
$\frac{0}{\infty}, \frac{1}{\infty}, 0^\infty$	0
Indeterminate form	tricks
$\frac{\infty}{\infty}, \frac{0}{0}$	will see today
$0 \cdot \infty$	will see on Friday
$0^0, \infty^0, 1^\infty$	will see on Friday

Simplify indeterminate form

Example Consider

$$\lim_{x \rightarrow 0} \frac{(x-2)^2 - 4}{3x}$$

Which indeterminate form is this? Compute by simplifying it.

Simplify indeterminate form

Example Evaluate the limit

$$\lim_{x \rightarrow 0} \frac{|x|}{2x}$$

1. Is 0 in the domain of this function?
2. How do we simplify this function?

Multiply by a conjugate

Recall the formula

$$(X + Y)(X - Y) = X^2 - Y^2.$$

This means

$$(\sqrt{A} + \sqrt{B})(\sqrt{A} - \sqrt{B}) = \boxed{}.$$

Trick If you start with an indeterminate form with something in the denominator/numerator like

$$(\sqrt{A} + \sqrt{B})$$

you can multiply both denominator and numerator by its **conjugate**

$$(\sqrt{A} - \sqrt{B})$$

and things might magically work out.

Example: Multiply by a conjugate

Example Evaluate

$$\lim_{x \rightarrow 1^+} \frac{(x-1)^2}{\sqrt{x+2} - \sqrt{2x+1}}$$

Try multiplying the conjugate on both the denominator and numerator.

L'Hospital's rule

Theorem (L'Hospital's rule, or L'Hôpital's rule if you are fancy)
If

$$\lim_{x \rightarrow a} \frac{f(x)}{g(x)}$$

has indeterminate form $\frac{0}{0}$ or $\frac{\infty}{\infty}$, then

$$\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \lim_{x \rightarrow a} \frac{f'(x)}{g'(x)}$$

as long as RHS exists or equal to ∞ or $-\infty$.

Example: L'Hospital's rule

Example Use L'Hospital's rule to solve

$$\lim_{x \rightarrow 0} \frac{\sin x}{2x}$$

1. The limit is of indeterminate form
2. Taking derivative of both denominator and numerator, we get

$$\lim_{x \rightarrow 0} \frac{\cos x}{2}$$

3. This new limit is no longer a indeterminate form, and evaluates to

$$\lim_{x \rightarrow 0} \frac{\cos x}{2} = \frac{1}{2}$$

4. The result exists, so L'Hospital's rule applies, and we conclude the original limit is .

Example: L'Hospital's rule

Example Use L'Hospital's rule to solve

$$\lim_{x \rightarrow \infty} \frac{\sqrt{x^2 - 1}}{x}$$

Example: L'Hospital's rule not working

Example We saw L'Hospital's rule doesn't work for

$$\lim_{x \rightarrow \infty} \frac{\sqrt{x^2 - 1}}{x}$$

What else can we try to find the limit?

1. Simplification?
2. Multiply by conjugates?

example:L'Hospital's rule

Example Use L'Hospital's rule to solve

$$\lim_{x \rightarrow \infty} \frac{x + \sin x}{x}$$

Example: L'Hospital's rule not working

Example We saw L'Hospital's rule doesn't work for

$$\lim_{x \rightarrow \infty} \frac{x + \sin x}{x}$$

What else can we try to find the limit?

Summary

Determinate form	evaluation
$\frac{1}{0^+}, \frac{\infty}{0^+}, \infty + \infty, \infty^\infty$	∞
$\frac{1}{0^-}, \frac{\infty}{0^-}$	$-\infty$
$\frac{0}{\infty}, \frac{1}{\infty}, 0^\infty$	0
Indeterminate form	tricks
$\frac{\infty}{\infty}, \frac{0}{0}$	simplify multiply conjugate L'Hospital's rule
$0 \cdot \infty$	will see on Friday
$0^0, \infty^0, 1^\infty$	will see on Friday
